CSE- Academic Year 2026-27

Java Programming – Lab Batch 2025-29

Lab Assignment No:- 19	
Name of Student	**Arhaan Hussain Khan**
PRN No.	**25070122045**
Batch	**A-2**
Class	**Second Year**
Academic Year & Semester	**26-27 & 3rd Sem**
Date of Submission	2/09/2026
Title of Assignment :	**Develop a Java application to establish connectivity with a database and perform data retrieval using the SELECT operation.**

Practice questions
 	
Output Screenshots Solve questions on given link and attach screen shot of leetcode with your login and o/p
	1. Develop a Java application to establish connectivity with a database and perform data retrieval using the SELECT operation.
	
	import java.sql.*;
	
	public class DatabaseSelect {
	public static void main(String[] args) {
	String url = "jdbc:mysql://localhost:3306/studentdb";
	String username = "root";
	String password = "root";

```
        try {
            Class.forName("com.mysql.cj.jdbc.Driver");

            Connection con = DriverManager.getConnection(url,
username, password);

            Statement stmt = con.createStatement();

            String query = "SELECT * FROM student";
            ResultSet rs = stmt.executeQuery(query);

            System.out.println("Student Records");
            System.out.println("------------------------");

            while (rs.next()) {
                System.out.println("Roll No: " + rs.getInt("roll_no"));
                System.out.println("Name: " + rs.getString("name"));
                System.out.println("Course: " + rs.getString("course"));
                System.out.println("------------------------");
            }

            rs.close();
            stmt.close();
            con.close();

        } catch (Exception e) {
```

```
            System.out.println("Error: " + e.getMessage());
        }
    }
}
```

2.Create a Java application that connects to a database and displays product detailsusing a SELECT query. Show product ID, product name, quantity, and price.

```
import java.sql.*;

public class ProductDetails {
    public static void main(String[] args) {
        String url = "jdbc:mysql://localhost:3306/productdb";
        String username = "root";
        String password = "root";

        try {
            Class.forName("com.mysql.cj.jdbc.Driver");

            Connection con = DriverManager.getConnection(url, username, password);

            Statement stmt = con.createStatement();

            String query = "SELECT * FROM product";
            ResultSet rs = stmt.executeQuery(query);
```

```
            System.out.println("Product Details");
            System.out.println("---------------------------------------");
            System.out.println("ID\tName\t\tQuantity\tPrice");
            System.out.println("---------------------------------------");

            while (rs.next()) {
                int id = rs.getInt("product_id");
                String name = rs.getString("product_name");
                int quantity = rs.getInt("quantity");
                double price = rs.getDouble("price");

                System.out.println(id + "\t" + name + "\t\t"
                        + quantity + "\t\t" + price);
            }

            rs.close();
            stmt.close();
            con.close();

        } catch (Exception e) {
            System.out.println("Error: " + e.getMessage());
        }
    }
}
```

Output Screenshots	

(if applicable)	 
Conclusion	The program successfully establishes a **JDBC connection** with the database and retrieves product details using a **SELECT query**. It displays the **Product ID, Product Name, Quantity, and Price** of the products stored in the database.
